

## Answer to Question No: 1

As per a report of UNICEF, WHO 1 of 3 people do not have the access for clean drinking water. The major facts due to which there is a scarcity of safe water is among the all available water in the world only 2.5% of water is fresh while the other 97.5% of water is salt water. Again, of that 2.5% of fresh water only around 30% is available for drinking while other 68%+ water are either glaciers or snow covered.

I do not think next world war could be occurred due to safe drinking water. I know there is a great scarcity of fresh drinking water and as day passes the scarcity is increasing in regular basis. But, fact is as an engineering student from technological point of view I think its not far from today that we can produce drinking water from the sea-water. The technology is already invented; we just need to make it more efficient and available for the mass people. Besides, the technology of water treatment is also available to improve the quality of water for specific end use.

So, there are lots possibilities and ways are already invented and lots of are under process to make fresh water available for all. Though there is scarcity but there are also huge chance to cope up and meet up with the scarcity. Therefore from my point of view, next world won't occur due to safe drinking water.

Deforestation is the evacuation of woodland or stands of trees from which is at that point changed over to a non-forest utilize. In current times it is one of the rising topic all around the world. The situation is unchanged in Bangladesh as well. If we look through the causes of deforestation in Bangladesh the major causes we would see are discussed below:

The first one is, we have huge population & it is increasing day by day. To accommodate the population we cutting down trees and make land for living.

Another thing is with the increment of population we need to increase the cultivation quantity as well. So, by cutting down trees our farmers are spreading the cultivation area.

Thirdly, due urbanization to build communication infrastructure and industrialization deforestation is happening.

Fourthly, some person are demolishing the forest product unlawfully which destroying the ecosystem of a forest causing deforestation in some cases.

Fifthly, Brick Fields needs a huge amount of wood everyday which actually meet up by cutting trees.

Apart from these facts, we knowingly or unknowingly destroying & polluting environment. This also hampers the suitable condition for a forest to survive.
